PERSONAL STATEMENT

Computer Science student with experience building backend, fullstack, and general software applications using Kotlin, Java, and TypeScript. I've worked on desktop apps, websites, and game modifications, with experience in event systems, networking, and computer graphics through personal projects and hackathons.

I also founded and manage a game modification community of 3000+ members, providing technical support, mentoring developers, and contributing to collaborative software projects.

EDUCATION

Bachelor of Computer Science , University of Auckland	Expected 2028
NCEA Scholarship in Digital Technologies , Rotorua Lakes High School	Finished 2025

PROJECTS

DataLens. Built a Windows desktop file search tool using indexed file system scanning, enabling fast, low-latency queries across large directories.

- Technologies Used: Kotlin, SQLite, Compose Multiplatform, Git, GitHub + Workflows for CI/CD and unit testing

Bonus3. Collaborated on a Web3 employee bonus distribution platform at the 2026 Web3 Hackathon run by the [Web3 UoA](#) club, implementing smart contracts and blockchain interactions.

- Technologies Used: Bun/Hono Backend with Typescript, Vite/TanStack Frontend, Foundry + Solidity + Sepolia Network for deploying smart contracts, Git, GitHub

Apollointhehouse-Web. My personal website, built using the kotlin programming language, the code generates a static website which is then deployed to Cloudflare Pages. The code is automatically run using a GitHub Workflow for CI/CD. Every time the website is regenerated it automatically fetches all of my GitHub projects using the GitHub GraphQL API and displays them on the website.

- Technologies Used: Kotlin, KTor Client, Git, GitHub + Workflows for CI/CD, GitHub API, KotlinX HTML, PicoCSS

Comet. A modified client for Minecraft, developed alongside 4 others over several years, giving me an understanding of network security as it pertains to server-side code.

- Technologies Used: Kotlin, Java, Fabric, Sponge Mixin, Pub/Sub Event System, OpenGL, Kotlinx Coroutines, Git, GitHub + Workflow

AAsm. Built a custom assembler, emulator, and disassembler in Kotlin for a 16-bit instruction set architecture based on the CS 110 textbook machine, supporting assembly, execution with debug tracing, and disassembly.

- Technologies Used: Kotlin, Git, GitHub

SKILLS

Programming Languages	Java, Kotlin, Python, JavaScript, TypeScript
Frontend	HTML, CSS, Compose Multiplatform
Technologies	Git, SQLite, KTor, Flask, Express, Hono
